

# API Vulnerability Scanner Report

✓ <http://rest.testinvicti.com/jwt/>

## Summary

### Overall risk level:

**Critical**

### Risk ratings:

Critical: **2**

High: **3**

Medium: **1**

Low: **7**

Info: **44**

### Scan information:

Start time: Feb 12, 2025 / 09:48:50 UTC+02

Finish time: Feb 12, 2025 / 09:58:10 UTC+02

Scan duration: 9 min, 20 sec

Tests performed: 57/57

Scan status: **Finished**

## Findings

### SQL Injection

**CONFIRMED**

URL	Method	Vulnerable Parameter	Evidence	Replay Attack
<a href="http://rest.testinvicti.com/jwt/api/users/test_username">http://rest.testinvicti.com/jwt/api/users/test_username'</a>	GET	Url Path	<p>Injecting the value <code>'</code> in the URL path generated the following error(s) in the response:</p> <pre>SQL errorPDOException: SQLSTATE[42000]: Syntax error or access violation: 1064 You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near 'test_username'' at line 1 in /var/www/src/routes/users.php:67</pre> <p><a href="#">Request / Response</a></p>	

#### Details

#### Risk description:

The risk exists that an attacker gains unauthorized access to the information from the database of the application. He could extract and alter information such as: application usernames, passwords, client information and other application specific data.

#### Recommendation:

We recommend implementing a validation mechanism for all the data received from the users.  
The best way to protect against SQL Injection is to use prepared statements for every SQL query performed on the database.  
Otherwise, the user input can also be sanitized using dedicated methods such as: `mysqli_real_escape_string`.

#### Classification:

CWE : [CWE-89](#)  
OWASP Top 10 - 2017 : [A1 - Injection](#)  
OWASP Top 10 - 2021 : [A3 - Injection](#)

### OS Command Injection

**CONFIRMED**

URL	Method	Vulnerable Parameter	Evidence	Replay Attack
-----	--------	----------------------	----------	---------------

<a href="http://rest.testinvicti.com/jwt/api/users/test_username">http://rest.testinvicti.com/jwt/api/users/test_username</a>	PUT	email (Body Parameter)	<p>Injected the <code>echo</code>  <code>ttp1739346686.63417 rev sed -e</code>  <code>'s/^/ptt/' -e 's/\./dot/' tr a-z</code>  <code>A-Z</code> command in the email body  parameter and found the expected  command output  ( <code>PTT71436D0T6866439371PTT</code> ) in the  response</p> <p>To validate the vulnerability, we  extracted the kernel version and the  hostname of the Unix machine. The  kernel version is <code>5.4.0-1092-aws</code>, and  the hostname is <code>0ac63cf9ce6c</code>.</p> <p><a href="#">Request / Response</a></p>	
---	-----	------------------------------	---	---

▼ Details

**Risk description:**

The risk is that an attacker can use the application to run OS commands with the privileges of the vulnerable application. This could lead (but not limited) to Remote Code Execution, Denial of Service, Sensitive Information Disclosure, Sensitive Information Deletion.

**Recommendation:**

There are multiple ways to mitigate this attack:

- avoid calling OS commands directly (use built-in library functions) - escape values added to OS commands specific to each OS
- implement parametrization in conjunction with Input Validation (segregate data by command; implement Positive or whitelist input validation; White list Regular Expression)

In order to provide Defense in Depth, we also recommend to allocate the lowest privileges to web applications.

[https://cheatsheetseries.owasp.org/cheatsheets/OS\\_Command\\_Injection\\_Defense\\_Cheat\\_Sheet.html](https://cheatsheetseries.owasp.org/cheatsheets/OS_Command_Injection_Defense_Cheat_Sheet.html)

**Classification:**

CWE : [CWE-78](#)  
OWASP Top 10 - 2017 : [A1 - Injection](#)  
OWASP Top 10 - 2021 : [A3 - Injection](#)

## JWT Weak Secret Key

CONFIRMED

URL	Method	Parameters	Evidence
<a href="http://rest.testinvicti.com/jwt/">http://rest.testinvicti.com/jwt/</a>	GET	<p><b>Headers:</b></p> <p>Authorization=Bearer  eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiIsImtpZCI6InNlY3JldC50eHQifQ.eyJ1c2VyljoidGVzdCJ9.jqBFzyBB68KWiOvEJhcaDgMY0Gea-tOKNnf-fR2loyc</p> <p>User-Agent=Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/108.0.0.0 Safari/537.36</p>	<p>The JWT (header <code>{'typ': 'JWT', 'alg': 'HS256', 'kid': 'secret.txt'}</code>, payload <code>{'user': 'test'}</code>) was signed with a weak secret key. We found its value, <code>supersecret</code>, in a dictionary of common secrets.</p>

▼ Details

**Risk description:**

The risk is that an attacker can forge a valid JWT by guessing or brute-forcing the secret key, gaining unauthorized access to the application. This can lead to impersonating another user, usually resulting in privilege escalation.

**Recommendation:**

Use strong, random, and unique secret keys for signing JWTs. Avoid using easily guessable, common, or default strings as keys. Implement a robust key management system to securely store and rotate keys. Regularly review and update keys to ensure their security.

**References:**

[https://owasp.org/www-project-web-security-testing-guide/latest/4-Web\\_Application\\_Security\\_Testing/06-Session\\_Management\\_Testing/10-Testing\\_JSON\\_Web\\_Tokens](https://owasp.org/www-project-web-security-testing-guide/latest/4-Web_Application_Security_Testing/06-Session_Management_Testing/10-Testing_JSON_Web_Tokens)

**Classification:**

CWE : [CWE-347](#)  
OWASP Top 10 - 2017 : [A5 - Broken Access Control](#)  
OWASP Top 10 - 2021 : [A2 - Cryptographic Failures](#)

URL	Method	Vulnerable Parameter	Evidence	Replay Attack
<a href="http://rest.testinvicti.com/jwt/api/comments/21">http://rest.testinvicti.com/jwt/api/comments/21</a>	PUT	comment (Body Parameter)	<p>We found a Local File Inclusion vulnerability in the comment body parameter. We managed to read the contents of two files.</p> <p>First, we tested for the vulnerability by injecting the payload: <code>/proc/cpuinfo</code>. We extracted the data:</p> <pre>processor : 0 vendor_id : GenuineIntel cpu family : 6 model : 79 model name : Intel stepping : 1 microcode : 0x5003801 processor : 1 vendor_id : GenuineIntel cpu family : 6</pre> <p>Additionally, we validated the vulnerability by injecting the payload: <code>/proc/1/sched</code>. The extracted data was:</p> <pre>se.exec_start : 3365298.605765 se.vruntime : 125673.795813 se.sum_exec_runtime : 696.115095 se.nr_migrations : 1 nr_switches : 4196 nr_voluntary_switches : 3952 nr_involuntary_switches : 244 se.load.weight : 1048576 se.avg.load_sum : 30 se.avg.util_sum : 30720</pre> <p><a href="#">Request / Response</a></p>	

▼ Details

**Risk description:**

The risk exists that an attacker can manipulate the affected parameter in order to load and sometimes execute any locally stored file. This could lead to reading arbitrary files, code execution, Cross-Site Scripting, denial of service, sensitive information disclosure.

**Recommendation:**

The most effective solution to eliminating file inclusion vulnerabilities is to avoid passing raw user-submitted input to any filesystem API. If this is not possible, the application can maintain a white list of files that may be included by the page, and then check to see if the user input matches against any of the entries in the white list. Any request containing an invalid identifier has to be rejected. In this way, there is no attack surface for malicious users to manipulate the path.

OWASP Top 10 - 2021 : [A1 - Broken Access Control](#)

Vulnerabilities found for server-side software

Risk Level	CVSS	CVE	Summary	Affected software
------------	------	-----	---------	-------------------

●	9.8	<a href="#">CVE-2023-25690</a>	<p>Some mod_proxy configurations on Apache HTTP Server versions 2.4.0 through 2.4.55 allow a HTTP Request Smuggling attack.</p> <p>Configurations are affected when mod_proxy is enabled along with some form of RewriteRule or ProxyPassMatch in which a non-specific pattern matches some portion of the user-supplied request-target (URL) data and is then re-inserted into the proxied request-target using variable substitution. For example, something like:</p> <pre>RewriteEngine on RewriteRule "^/here/(.*)" "http://example.com:8080/elsewhere?\$1"; [P] ProxyPassReverse /here/ http://example.com:8080/</pre> <p>Request splitting/smuggling could result in bypass of access controls in the proxy server, proxying unintended URLs to existing origin servers, and cache poisoning. Users are recommended to update to at least version 2.4.56 of Apache HTTP Server.</p>	http_server 2.4.25
●	9.8	<a href="#">CVE-2024-38474</a>	<p>Substitution encoding issue in mod_rewrite in Apache HTTP Server 2.4.59 and earlier allows attacker to execute scripts in directories permitted by the configuration but not directly reachable by any URL or source disclosure of scripts meant to only to be executed as CGI.</p> <p>Users are recommended to upgrade to version 2.4.60, which fixes this issue.</p> <p>Some RewriteRules that capture and substitute unsafely will now fail unless rewrite flag "UnsafeAllow3F" is specified.</p>	http_server 2.4.25
●	9.8	<a href="#">CVE-2024-38476</a>	<p>Vulnerability in core of Apache HTTP Server 2.4.59 and earlier are vulnerably to information disclosure, SSRF or local script execution via backend applications whose response headers are malicious or exploitable.</p> <p>Users are recommended to upgrade to version 2.4.60, which fixes this issue.</p>	http_server 2.4.25
●	9	<a href="#">CVE-2022-36760</a>	<p>Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') vulnerability in mod_proxy_ajp of Apache HTTP Server allows an attacker to smuggle requests to the AJP server it forwards requests to. This issue affects Apache HTTP Server Apache HTTP Server 2.4 version 2.4.54 and prior versions.</p>	http_server 2.4.25
●	7.8	<a href="#">CVE-2019-9517</a>	<p>Some HTTP/2 implementations are vulnerable to unconstrained internal data buffering, potentially leading to a denial of service. The attacker opens the HTTP/2 window so the peer can send without constraint; however, they leave the TCP window closed so the peer cannot actually write (many of) the bytes on the wire. The attacker then sends a stream of requests for a large response object. Depending on how the servers queue the responses, this can consume excess memory, CPU, or both.</p>	http_server 2.4.25
●	7.5	<a href="#">CVE-2017-8923</a>	<p>The zend_string_extend function in Zend/zend_string.h in PHP through 7.1.5 does not prevent changes to string objects that result in a negative length, which allows remote attackers to cause a denial of service (application crash) or possibly have unspecified other impact by leveraging a script's use of .= with a long string.</p>	php 7.1.26
●	7.5	<a href="#">CVE-2019-9641</a>	<p>An issue was discovered in the EXIF component in PHP before 7.1.27, 7.2.x before 7.2.16, and 7.3.x before 7.3.3. There is an uninitialized read in exif_process_IFD_in_TIFF.</p>	php 7.1.26
●	7.5	<a href="#">CVE-2019-13224</a>	<p>A use-after-free in onig_new_deluxe() in regext.c in Oniguruma 6.9.2 allows attackers to potentially cause information disclosure, denial of service, or possibly code execution by providing a crafted regular expression. The attacker provides a pair of a regex pattern and a string, with a multi-byte encoding that gets handled by onig_new_deluxe(). Oniguruma issues often affect Ruby, as well as common optional libraries for PHP and Rust.</p>	php 7.1.26
●	7.5	<a href="#">CVE-2019-11043</a>	<p>In PHP versions 7.1.x below 7.1.33, 7.2.x below 7.2.24 and 7.3.x below 7.3.11 in certain configurations of FPM setup it is possible to cause FPM module to write past allocated buffers into the space reserved for CGI protocol data, thus opening the possibility of remote code execution.</p>	php 7.1.26

	6.8	<a href="#">CVE-2019-9675</a>	An issue was discovered in PHP 7.x before 7.1.27 and 7.3.x before 7.3.3. <code>phar_tar_writeheaders_int</code> in <code>ext/phar/tar.c</code> has a buffer overflow via a long link value. NOTE: The vendor indicates that the link value is used only when an archive contains a symlink, which currently cannot happen: "This issue allows theoretical compromise of security, but a practical attack is usually impossible."	php 7.1.26
---	-----	-------------------------------	--	------------

▼ Details

**Risk description:**

The risk is that an attacker could search for an appropriate exploit (or create one himself) for any of these vulnerabilities and use it to attack the system.

**Recommendation:**

In order to eliminate the risk of these vulnerabilities, we recommend you check the installed software version and upgrade to the latest version.

**Classification:**

CWE : [CWE-1026](#)

OWASP Top 10 - 2017 : [A9 - Using Components with Known Vulnerabilities](#)

OWASP Top 10 - 2021 : [A6 - Vulnerable and Outdated Components](#)

## Communication is not secure

CONFIRMED

URL	Response URL	Evidence
<a href="http://rest.testinvicti.com/jwt/">http://rest.testinvicti.com/jwt/</a>	<a href="http://rest.testinvicti.com/jwt/">http://rest.testinvicti.com/jwt/</a>	Communication is made over unsecure, unencrypted HTTP.

▼ Details

**Risk description:**

The risk is that an attacker who manages to intercept the communication at the network level can read and modify the data transmitted (including passwords, secret tokens, credit card information and other sensitive data).

**Recommendation:**

We recommend you to reconfigure the web server to use HTTPS - which encrypts the communication between the web browser and the server.

**Classification:**

CWE : [CWE-311](#)

OWASP Top 10 - 2017 : [A3 - Sensitive Data Exposure](#)

OWASP Top 10 - 2021 : [A4 - Insecure Design](#)

## Missing security header: X-Content-Type-Options

CONFIRMED

URL	Evidence
<a href="http://rest.testinvicti.com/jwt/api/users">http://rest.testinvicti.com/jwt/api/users</a>	Response headers do not include the X-Content-Type-Options HTTP security header <a href="#">Request / Response</a>

▼ Details

**Risk description:**

The risk is that lack of this header could make possible attacks such as Cross-Site Scripting or phishing in Internet Explorer browsers.

**Recommendation:**

We recommend setting the X-Content-Type-Options header such as `X-Content-Type-Options: nosniff`.

**References:**

<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/X-Content-Type-Options>

**Classification:**

CWE : [CWE-693](#)

OWASP Top 10 - 2017 : [A6 - Security Misconfiguration](#)

OWASP Top 10 - 2021 : [A5 - Security Misconfiguration](#)

## Missing security header: Content-Security-Policy

CONFIRMED

URL	Evidence
<a href="http://rest.testinvicti.com/jwt/api/users">http://rest.testinvicti.com/jwt/api/users</a>	Response does not include the HTTP Content-Security-Policy security header or meta tag <a href="#">Request / Response</a>

▼ Details

**Risk description:**

The risk is that if the target application is vulnerable to XSS, lack of this header makes it easily exploitable by attackers.

**Recommendation:**

Configure the Content-Security-Header to be sent with each HTTP response in order to apply the specific policies needed by the application.

**References:**

[https://cheatsheetseries.owasp.org/cheatsheets/Content\\_Security\\_Policy\\_Cheat\\_Sheet.html](https://cheatsheetseries.owasp.org/cheatsheets/Content_Security_Policy_Cheat_Sheet.html)  
<https://developer.mozilla.org/en-US/docs/Web/HTTP/Headers/Content-Security-Policy>

**Classification:**

CWE : [CWE-693](#)  
OWASP Top 10 - 2017 : [A6 - Security Misconfiguration](#)  
OWASP Top 10 - 2021 : [A5 - Security Misconfiguration](#)

## 🚩 Missing security header: Referrer-Policy

CONFIRMED

URL	Evidence
<a href="http://rest.testinvicti.com/jwt/api/users">http://rest.testinvicti.com/jwt/api/users</a>	Response headers do not include the Referrer-Policy HTTP security header as well as the <meta> tag with name 'referrer' is not present in the response. <a href="#">Request / Response</a>

▼ Details

**Risk description:**

The risk is that if a user visits a web page (e.g. "http://example.com/pricing/") and clicks on a link from that page going to e.g. "https://www.google.com", the browser will send to Google the full originating URL in the **Referer** header, assuming the Referrer-Policy header is not set. The originating URL could be considered sensitive information and it could be used for user tracking.

**Recommendation:**

The Referrer-Policy header should be configured on the server side to avoid user tracking and inadvertent information leakage. The value **no-referrer** of this header instructs the browser to omit the Referer header entirely.

**References:**

[https://developer.mozilla.org/en-US/docs/Web/Security/Referer\\_header:\\_privacy\\_and\\_security\\_concerns](https://developer.mozilla.org/en-US/docs/Web/Security/Referer_header:_privacy_and_security_concerns)

**Classification:**

CWE : [CWE-693](#)  
OWASP Top 10 - 2017 : [A6 - Security Misconfiguration](#)  
OWASP Top 10 - 2021 : [A5 - Security Misconfiguration](#)

## 🚩 Internal Server Error Found

CONFIRMED

URL	Method	Parameters	Evidence
<a href="http://rest.testinvicti.com/jwt/">http://rest.testinvicti.com/jwt/</a>	GET	<b>Headers:</b> Authorization=Bearer eyJ0eXAiOiJKV1QiLCJhbGciOiJIUzI1NiIsImtpZCI6InNY3JldC50eHQifQ.eyJ1c2VyljoidGVzdCJ9.jqBFzyBB68KWiOvEJhcaDgMY0Gea-t0KNnf-fr2loyc User-Agent=Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/108.0.0.0 Safari/537.36 X-HTTP-Me...	Response has an internal server error status code: 500 <a href="#">Request / Response</a>

▼ Details

**Risk description:**

The risk exists that attackers could utilize information revealed in Internal Server Error messages to mount more targeted and effective attacks. Detailed error messages could, for example, expose a path traversal weakness (CWE-22) or other exploitable system vulnerabilities.

**Recommendation:**

Ensure that error messages only contain minimal details that are useful to the intended audience, and nobody else. The messages need to strike the balance between being too cryptic and not being cryptic enough. They should not necessarily reveal the methods that were used to determine the error. Such detailed information can be used to refine the original attack to increase the chances of success. If errors must be tracked in some detail, capture them in log messages - but consider what could occur if the log messages can be viewed by attackers. Avoid recording highly sensitive information such as passwords in any form. Avoid inconsistent messaging that might accidentally tip off an attacker about internal state, such as whether a username is valid or not.

**Classification:**

CWE : [CWE-209](#)

OWASP Top 10 - 2017 : [A6 - Security Misconfiguration](#)

OWASP Top 10 - 2021 : [A5 - Security Misconfiguration](#)

## Server software and technology found

UNCONFIRMED ⓘ

Software / Version	Category
 <a href="#">Debian</a>	Operating systems
 <a href="#">Apache HTTP Server 2.4.25</a>	Web servers
 <a href="#">PHP 7.1.26</a>	Programming languages

▼ Details

**Risk description:**

The risk is that an attacker could use this information to mount specific attacks against the identified software type and version.

**Recommendation:**

We recommend you to eliminate the information which permits the identification of software platform, technology, server and operating system: HTTP server headers, HTML meta information, etc.

**References:**

OWASP Top 10 - 2021 : [A4 - Insecure Design](#)

## 🚩 Enumerable Parameter

UNCONFIRMED ⓘ

URL	Method	Vulnerable Parameter	Evidence
<a href="http://rest.testinvicti.com/jwt/api/comments/20">http://rest.testinvicti.com/jwt/api/comments/20</a>	GET	Url Path	The URL path appears to contain an enumerable numeric part. We modified its initial value 21 to 20 and the two responses were 11% similar. The parameter may introduce an Insecure Direct Object Reference (IDOR) vulnerability. <a href="#">Request / Response</a>
<a href="http://rest.testinvicti.com/jwt/api/posts/20">http://rest.testinvicti.com/jwt/api/posts/20</a>	GET	Url Path	The URL path appears to contain an enumerable numeric part. We modified its initial value 21 to 20 and the two responses were 45% similar. The parameter may introduce an Insecure Direct Object Reference (IDOR) vulnerability. <a href="#">Request / Response</a>
<a href="http://rest.testinvicti.com/jwt/api/posts/4/comments">http://rest.testinvicti.com/jwt/api/posts/4/comments</a>	GET	Url Path	The URL path appears to contain an enumerable numeric part. We modified its initial value 5 to 4 and the two responses were 1% similar. The parameter may introduce an Insecure Direct Object Reference (IDOR) vulnerability. <a href="#">Request / Response</a>

<a href="http://rest.testinvicti.com/jwt/api/users/ena6/posts">http://rest.testinvicti.com/jwt/api/users/ena6/posts</a>	GET	Url Path	The URL path appears to contain an enumerable numeric part. We modified its initial value ena07 to ena6 and the two responses were 10% similar. The parameter may introduce an Insecure Direct Object Reference (IDOR) vulnerability. <a href="#">Request / Response</a>
---	-----	----------	---

▼ Details

**Risk description:**

The vulnerability allows attackers to brute-force parameter values to uncover and access unauthorized resources and functionalities.

**Recommendation:**

Ensure that parameter values would not reveal sensitive information and that the application properly checks the user's authorization to access the resource. Also, the resource IDs should not be predictable.

**References:**

[Testing for Insecure Direct Object References](#)

**Classification:**

CWE : [CWE-284](#)

OWASP Top 10 - 2021 : [A1 - Broken Access Control](#)

## Security.txt file is missing

CONFIRMED

URL
Missing: <a href="http://rest.testinvicti.com/.well-known/security.txt">http://rest.testinvicti.com/.well-known/security.txt</a>

▼ Details

**Risk description:**

There is no particular risk in not having a security.txt file for your server. However, this file is important because it offers a designated channel for reporting vulnerabilities and security issues.

**Recommendation:**

We recommend you to implement the security.txt file according to the standard, in order to allow researchers or users report any security issues they find, improving the defensive mechanisms of your server.

**References:**

<https://securitytxt.org/>

#### ▼ Details

##### Risk description:

The risk is that path disclosure may help an attacker learn more about the remote server's file system, thus increasing the effectiveness and precision of any future attacks.

##### Recommendation:

Configure the web server to avoid leaking path information by using generic error messages that do not reveal any internal file paths. Make sure no server file is referred with its absolute path in the website code.

▼ Details

**Risk description:**

The table contains all the unique pages the scanner found. The duplicated URLs are not available here as scanning those is considered unnecessary

**Recommendation:**

We recommend to advanced users to make sure the scan properly detected most of the URLs in the application.

**References:**

[All the URLs the scanner found, including duplicates](#) (available for 90 days after the scan date)

🚩 Api is accessible.

🚩 Nothing was found for CORS misconfiguration.

🚩 Nothing was found for use of untrusted certificates.

🚩 Nothing was found for enabled HTTP debug methods.

🚩 Nothing was found for enabled HTTP OPTIONS method.

🚩 Nothing was found for GraphQL endpoints.

🚩 Nothing was found for directory listing.

🚩 Nothing was found for passwords submitted unencrypted.

🚩 Nothing was found for debug messages.

🚩 Nothing was found for code comments.

🚩 Nothing was found for missing HTTP header - Strict-Transport-Security.

---

🚩 Nothing was found for XML External Entity Injection.

---

🚩 Nothing was found for passwords submitted in URLs.

---

🚩 Nothing was found for JWT weaknesses.

---

🚩 Nothing was found for domain too loose set for cookies.

---

🚩 Nothing was found for mixed content between HTTP and HTTPS.

---

🚩 Nothing was found for cross domain file inclusion.

---

🚩 Nothing was found for HttpOnly flag of cookie.

---

🚩 Nothing was found for Secure flag of cookie.

---

🚩 Nothing was found for login interfaces.

---

🚩 Nothing was found for secure password submission.

---

🚩 Nothing was found for sensitive data.

---

🚩 Nothing was found for Server Side Request Forgery.

---

🚩 Nothing was found for Open Redirect.

---

🚩 Nothing was found for PHP Code Injection.

---

🚩 Nothing was found for JavaScript Code Injection.

---

🚩 Nothing was found for Broken Authentication.

---

🚩 Nothing was found for Ruby Code Injection.

---

🚩 Nothing was found for Python Code Injection.

---

🚩 Nothing was found for Perl Code Injection.

---

🚩 Nothing was found for Remote Code Execution through Log4j.

---

🚩 Nothing was found for Server Side Template Injection.

---

🚩 Nothing was found for Remote Code Execution through VIEWSTATE.

---

🚩 Nothing was found for Request URL Override.

---

🚩 Nothing was found for HTTP/1.1 Request Smuggling.

---

🚩 Nothing was found for NoSQL Injection.

---

🚩 Nothing was found for Insecure Deserialization.

---

🚩 Nothing was found for unsafe HTTP header Content Security Policy.

---

🚩 Nothing was found for OpenAPI files.

---

🚩 Nothing was found for Session Token in URL.

---
